 LinkedIn |  deepalilanjewar07@gmail.com |  +91 7066523374 |  Pune, India

Technical Skills

Programming:	C++, Java, Python, SQL
Backend & Frameworks:	Spring Boot, Spring Microservices, REST APIs, Apache Kafka, Angular
Databases & Caching:	PostgreSQL, MongoDB, Redis
Concepts:	Data Structures & Algorithms (Solved 200+ DSA problems on LeetCode), System Design, Distributed Systems, OOPs, CI/CD Pipelines, Agile/Scrum, Debugging, Code Review
Tools & Platforms:	Git, GitLab CI/CD, Postman
Core Engineering:	Scalable Systems, Low-latency API design, Backend Optimization, Observability basics

Professional Experience

Software Engineer — Analyst A4, Capgemini

Oct 2024 – Present

- Owned and designed scalable **Spring Boot microservices** for a Real-Time Vehicle Tracking System, improving data processing latency by 30% through backend optimization and caching strategies.
- Built **RESTful APIs** handling concurrent requests with optimized backend performance under high traffic conditions.
- Took ownership of backend service reliability by debugging and resolving production issues through log analysis, dependency tracing, and system behavior monitoring.
- Actively participated in **code reviews**, providing feedback on design, performance, and maintainability to enforce engineering best practices across the team.
- Contributed to CI/CD automation by implementing **GitLab pipelines**, improving release cycles through automated build, test, and deployment workflows.
- Developed and maintained unit and integration test suites using **JUnit and Mockito**, ensuring production-grade code quality with 85%+ coverage.

Projects

Scalable URL Shortening Service

 Github

- Built a URL shortening system using Spring Boot and PostgreSQL to understand real-world backend system design, supporting URL creation, redirection, and expiry-based lifecycle management.
 - Implemented Base62 encoding using database-generated IDs to generate compact, collision-free short URLs.
 - Integrated Redis cache-aside strategy to understand caching mechanisms and reduce database dependency for frequently accessed URLs.
 - Implemented rate limiting logic to understand how APIs protect against excessive request loads and abuse scenarios.
 - Implemented Kafka-based asynchronous clickstream processing to explore event-driven architecture and decouple analytics processing from request flow.
 - Added logging and tracking for click analytics to understand observability, debugging, and system monitoring practices.
- Tech Stack:** Spring Boot, PostgreSQL, Redis, Apache Kafka, REST APIs
- Achievements:** Built this project to gain hands-on understanding of backend system design concepts including caching, asynchronous processing, and rate limiting.

AI Code Generator System (LLM-based Assistant)

 Github

- Built an AI coding assistant using **LangChain** and **Groq LLMs** to convert natural language prompts into working code projects.
 - Designed Planner, Architect, and Coder agents to structure requirements into executable engineering tasks.
 - Developed workflow for generating multi-file applications including REST APIs and web apps.
 - Created UI to generate, download, and run AI-generated projects locally.
- Tech Stack:** Python, LangChain, Groq LLMs, REST APIs
- Achievements:** Built this project to gain hands-on experience in LLM-based application development, multi-agent system design, and automated code generation workflows.

Education

Yeshwantrao Chavan College of Engineering (YCCE)

2020 – 2024

B.Tech in Information Technology

GPA: 7.9/10.0

Certifications and Achievements

- Microsoft Certified: Azure Data Fundamentals (DP-900)
- Represented in the State-level Junior Athletics Championship (Under-16), 2015
